Finite sequential game or game played on tree

→ We will study *stable* strategy profiles

Nash Equilibrium (NE)

A strategy profile is a **Nash Equilibrium** (NE) if none of the players has a profitable deviation as long as the other players don't change their strategy.

Nash Equilibrium (NE)

A strategy profile is a **Nash Equilibrium** (NE) if none of the players has a profitable deviation as long as the other players don't change their strategy.

Nash Equilibrium (NE)

A strategy profile is a **Nash Equilibrium** (NE) if none of the players has a profitable deviation as long as the other players don't change their strategy.

Other notions of Equilibrium

Subgame Perfect Equilibrium

A strategy profile is a **Subgame Perfect Equilibrium** (SPE) if this is a Nash Equilibrium in every subgame.

Strong Nash Equilibrium

A strategy profile is a **Strong Nash Equilibrium** (SNE) if no coalition of players has a profitable deviation.

6 Computer Networking

Particular Reachability Game

- **Not initialized**

Particular Reachability Game

- **Not** initialized
- Every player has the **same target**
→ not owned by a player and deadlock

Particular Reachability Game

$$p(10) < p(120)$$

- **Not** initialized
- Every player has the **same target**
→ not owned by a player and deadlock
- Players have preferences over the **paths**

Particular Reachability Game

$$p(10) < p(120)$$

- **Not** initialized
- Every player has the **same target**
 - not owned by a player and deadlock
- Players have preferences over the **paths**
 - Ex: shortest path

Static approach

- The game is played only once.
- Before playing, players decide which strategy they will play.
- If they decide to play a Nash Equilibrium, none of the player has interest to change his strategy.

Static approach

- The game is played only once.
- Before playing, players decide which strategy they will play.
- If they decide to play a Nash Equilibrium, none of the player has interest to change his strategy.

Static approach

- The game is played only once.
- Before playing, players decide which strategy they will play.
- If they decide to play a Nash Equilibrium, none of the player has interest to change his strategy.

Dynamic approach

If we discover a new game

- Find immediately a good strategy is concretely impossible.

Dynamic approach

If we discover a new game

- Find immediately a good strategy is concretely impossible.
- If we play several plays, we will improve our strategy.

Dynamic approach

If we discover a new game

- Find immediately a good strategy is concretely impossible.
- If we play several plays, we will improve our strategy.
- With enough different plays, will we eventually stabilize?

Dynamic approach

If we discover a new game

- Find immediately a good strategy is concretely impossible.
- If we play several plays, we will improve our strategy.
- With enough different plays, will we eventually stabilize?
- If so, will this strategy be a “good” strategy?

Dynamic approach

If we discover a new game

- Find immediately a good strategy is concretely impossible.
- If we play several plays, we will improve our strategy.
- With enough different plays, will we eventually stabilize?
- If so, will this strategy be a “good” strategy?

- Learning in games (e.g. fictitious play);
- Strategy improvement (e.g. in parity games);
- Evolutionary game theory (continuous time).

Dynamics

Allowing players to reconsider their strategy and update it into a better one, observing some conditions.

Dynamics

Allowing players to reconsider their strategy and update it into a better one, observing some conditions.

Dynamics

Allowing players to reconsider their strategy and update it into a better one, observing some conditions.

Dynamics

Allowing players to reconsider their strategy and update it into a better one, observing some conditions.

Questions

- What does *better one* means? What are the conditions over the updates?
- Does the dynamics always terminates?
- If so, what are the terminal profiles?
